

## **Individual Team Member Contribution**

### **Patrick Gandjouon Tchassem**

For this project, my individual contribution was completing and testing the Module 02 lab notebook. I worked through all the cells in Google Colab and made sure each cell executed successfully without errors. I reviewed the outputs as I worked to make sure the data, calculations, and visualizations were displayed correctly.

I also completed the analysis and reflection section of the notebook. I analyzed the Iris dataset by looking at the number of samples, features, and classes. I reviewed the scatter plot and identified patterns between the three Iris species. I observed that setosa was more clearly separated, while versicolor and virginica had more overlap.

I also answered the questions for further investigation and reflected on what I learned from using pandas, NumPy, and matplotlib. This part helped me better understand how statistics and visualizations can be used to explore data before building a machine learning model.

Before finishing my work, I ran the entire notebook again to verify that all cells executed successfully and that the outputs and visualizations were visible. My contribution focused on completing, testing, analyzing, and documenting the notebook portion of the group project.

### **Hashim Sayed Hoosini**

For this project, my contribution was to prepare the initial notebook and share it via a link with the team members. Also, I contributed as team lead, but due to some challenges, I was not able to lead the team, so I worked individually on the project.

I analyzed the dataset, loaded the data, and ran each code cell. I also reviewed the output for accuracy. Moreover, I prepared my reflection journal and organized my notebook, PDF, and README for this assignment.

### **Kenneth Russel Kouokam Meli**

For this project, my contribution focused on preparing the Module 02 notebook and documenting the results. I worked on the Iris dataset analysis, including the number of samples, measurement features, and species. I also described the main patterns in the visualizations, such as the clearer grouping of setosa and the overlap between versicolor and virginica. The analysis included the average sepal length, its standard deviation, and the equal number of samples in each species.

I also prepared the reflection journal and organized the notebook, PDF, and README for the group repository. The completed notebook contains saved outputs and both required visualizations, allowing the results to be viewed alongside the code. In the reflection, I discussed how pandas, NumPy, and matplotlib work together to explore data before building a machine learning model. My contribution covered the analysis, documentation, and preparation of the lab files.

### **Anavictoria Cavazos ITAI1371**

My personal contribution to this assignment was staying in communication with group members and making sure I did my assignments on time to not delay the process of submitting assignments. Also, on my part, I made sure to create a GitHub account to be able to collaborate for this assignment as well as future ones.

### **Saimi Manasiya**

As a team member team member contributed to the completion of the Module 02 Machine Learning Development Tools project by working with the provided Jupyter Notebook in Google Colab. Team member opened the Module\_02\_Lab\_Exercise.ipynb notebook reviewed the instructions and worked through the cells systematically. Team member also ran the notebook. Checked the outputs to make sure the code was executing properly. One of the main challenges team member experienced was becoming familiar with Google Colab and understanding how the notebook cells work. At first team member was unsure whether team member needed to create the 16 cells themselves and how the provided notebook should be opened and completed. After working with the notebook team member understood that the cells were already provided and that team members responsibility was to read the instructions complete the required code and run the cells to verify the results. Through this work team member gained an understanding of the tools commonly used in machine learning particularly pandas, NumPy and matplotlib. Team member learned that pandas can be used to organize and manipulate data NumPy helps perform operations efficiently and matplotlib can be used to visualize data. Team member also learned the importance of running code and checking outputs rather than assuming that the code is correct. team members contribution helped team member become more comfortable working with a machine-learning notebook environment and understanding the workflow required to complete the project. Team member also learned that troubleshooting and reading instructions carefully are parts of programming. Overall this project helped team member connect Python programming concepts, with machine-learning data analysis tasks.
